

AI Life Admin Assistant – Digital Bureaucracy Solver

A GenAI-powered Digital Case Worker for Citizen–Government Interactions

AI Life Admin

Problem Statement

Accessing public services remains a major challenge for citizens due to complex procedures, legal language, fragmented portals, and error-prone manual processes. The difficulty lies not in eligibility, but in navigating bureaucratic workflows correctly.

● Bureaucracy is not an information problem — it is a workflow problem.

Key challenges observed:

- Citizens are unaware of the correct forms and procedures, Minor mistakes lead to rejection without guidance
- Dependence on middlemen increases cost and corruption, Elderly and rural users face severe digital barriers

Motivation

Despite digitization efforts, government services remain inaccessible to large sections of society. Existing portals provide static information without personalized guidance. This project aims to eliminate procedural friction and enable independent access to services using GenAI.

💡 Our goal is not to explain procedures — but to complete them.

Application & Use Cases

The AI Life Admin Assistant functions as a digital case worker for:

- Scholarship and pension applications
- Insurance and welfare claims
- RTI and grievance submissions, income and community certificate requests

Proposed GenAI Method

The system leverages Large Language Models (LLMs) to convert unstructured citizen intent into structured, service-compliant documents through adaptive questioning and schema-driven validation. System Flow (At a Glance):

AI Life Admin Assistant – Digital Bureaucracy Solver

A GenAI-powered Digital Case Worker for Citizen–Government Interactions

User Problem → Intent Detection (LLM) → Smart Questioning → Structured Data → Rule Validation → Document Generation → Submission-Ready Output

✅ **From citizen intent to compliant document — end to end.**

Evaluation & Validation

The system will be evaluated using:

- Form completion accuracy
- Reduction in user steps and time
- Error rate compared to manual filling
- User satisfaction during pilot testing

Novelty , Competitive Advantage and Future Scope

Unlike traditional chatbots, this system uses GenAI to complete bureaucratic tasks end-to-end through adaptive questioning, validation, and document automation. Its modular design enables rapid scaling across services and regions, with future support for multilingual, voice, WhatsApp, and API-based submissions—saving time, cost, and effort while improving digital inclusion for rural, elderly, and first-time users.

Conclusion

AI Life Admin Assistant redefines the role of GenAI in governance — transforming it from a conversational assistant into an execution engine that converts citizen intent into institutional action.

 **An AI-powered digital case worker that turns life problems into submission-ready government documents.**
